What is ANPR?

ANPR is a new enforcement tool using a camera system to send images of number plates to a computer. The computer stores databases of registration numbers including vehicles not shown on an operator licence or not having a current test certificate for example. The system is designed to reduce the burden on compliant operators.

How does it work?

Registration numbers of vehicles are read by the computer. If there is a match between the database entry and the number plate on the vehicle an alarm sounds and the details are passed on to be followed up by the VOSA enforcement team.

Where will it be used?

The system can be operated mobile, at the side of the road, or from overbridges, covering up to 4 lanes of traffic at any one time, day or night, using infrared technology. Vehicles identified by the computer database, as not complying with the regulations, can then be directed to a check site to be examined or alternatively the details can be recorded and a visit to the operator's premises arranged.
